

Asset Collector

Automated
stocktaking
of networks

Part of
Damovo's
Automated Network Services

Advantages for you

- Simple detailing of inventory data for a better representation of the current status
- Less labour-intensive survey of complex networks and infrastructures
- Simple comparison of existing SLAs and service contracts with the current status
- Valid, up-to-date information for planning new investments or renewing service contracts
- Adherence to company compliance guidelines

The Damovo Asset Collector provides a simple, scalable and automated network inventory.

The Asset Collector can be used with APIC-EM inventory lists as well as in stand-alone mode.

Can be used by direct queries or import of inventory files (Excel/CSV formats).

Inventory data is enriched with up-to-date information such as end-of-sales, end-of-support, end-of-life and other operational data using the manufacturer API.

The inventory overview can be repeated at any time at the push of a button and thus reflects the current life cycle information of each network device immediately and without great effort.
