PENETRATION TESTING

FULL, MANUAL EXPLOITATION MIRRORING A REAL-WORLD ATTACK

Do you stay up late at night wondering if your organization can withstand an attack by a casual hacker? Could a motivated attacker target your business to get their hands on the sensitive data of your customers or the organization? Would your business be able to recover from such an incident?

Let Damovo Be Your Guide…

Damovo will help your organization validate its security posture through offensive security focused services such as complex adversarial simulations, penetration tests, insider threat assessments, vulnerability research, continuous security testing, and coaching.

PENETRATION TESTING OFFERINGS

PENETRATION TESTING

CONTINUOUS TESTING

INSIDER THREAT ASSESSMENT

OSINT SERVICES

HARDWARE

RF SPECTRUM

VULNERABILITY R&D

SUPPLY CHAIN TESTING

Damovo's team of senior consultants will work closely with your internal teams to measure the organization's defensive maturity and advance its security program.

Penetration Testing

We utilise an extensive assessment methodology to identify vulnerabilities and attack vectors that are typically missed by automated tools. After delivering a comprehensive report, Damovo will collaborate with your organization to formulate a remediation strategy to address gaps uncovered during the assessment. These assessments can be asset specific or goal oriented, black box or collaborative, enhancing the overall value of the engagement for your business.

Continuous Testing

When a new asset, configuration, or application is added to the environment, our engineers will conduct an in-depth security assessment, discover vulnerabilities, and determine the impact as changes occur within your enterprise.

Insider Threat Assessment

A large number of attacks originate from malicious employees in trusted roles. Damovo will conduct attacks from the point of view of a trusted employee or contractor and attempt to discover methods that can be leveraged to access your company's high-value targets and data.

OSINT Services

The Damovo team is trained in advanced intelligence collection and analysis techniques from the surface, deep, and dark web. We use these skills to identify all accessible information (both public and private) posing a threat to the security of your organization.

Hardware

A growing number of hardware devices are being implemented within your organization with inherent vulnerabilities. Damovo engineers will conduct an extensive assessment of the newly purchased device hardware, firmware, and identify any existing attack surface exposures.

RF Spectrum

The Damovo – Lares® assessment methodology goes beyond industry-standard radio-testing protocols such as 802.11, Bluetooth, and RFID. Our testing provides insight into communications systems such as GPS, cellular, process control networks, computer peripherals, and custom protocols to deliver unprecedented visibility into the entire RF vulnerability spectrum.

Vulnerability R&D

Damovo has a wealth of knowledge and experience with the discovery of vulnerabilities affecting COTS applications, custom networking protocols, hardware devices, autonomous or smart vehicles, and physical-access security controls. Our research experts have discovered and released security flaws enabling vendors to deliver a higher degree of security in their products.

Supply Chain Testing

We have created a unique service to replicate the connection and integration into your organization's supply chain, in order to identify vulnerabilities in its exposure. Together we will identify these exposures and threats before a breach can occur.

Lares is Damovo's cybersecurity division. Together we help companies secure electronic, physical, intellectual, and financial assets through a unique blend of assessment, testing, and coaching.
